

BabbleLabs Deep learning-based Command Recognition

Francis Kurupacheril, Senior Director of Product Management, BabbleLabs, Inc.

BabbleLabs Clear Command technology solves the immediate problem of directly communicating with your devices and applications using your native speech, language and accent, even in the presence of noise. Your devices may not have the resources to run large applications to support speech recognition or the capability of being consistently online. Clear Command establishes itself as an innovative AI solution enabling the control and use of resource optimized devices. Observe our technology where each command and language are distinctly and accurately recognized, and vocalized, to allow for actionable and impactful interaction.
